- Logical & Tautological Equivalence

S and S' are sentences of FOL built up from atomic sentences using truth-functional connectives. To test for tautological equivalence, we construct a joint truth table and check the final columns.

S and S' are *tautologically equivalent* if and only if every row of the joint truth table assigns the same values to S and S'.

If S and S' are tautologically equivalent, then they are *logically equivalent*.

Some logically equivalent sentences are not tautologically equivalent.

$$\begin{aligned} JJ &= \text{James} \wedge \text{boy}(JJ) \\ JJ &= \text{James} \wedge \text{boy}(\text{James}) \end{aligned}$$

- Logical & Tautological Consequence

Logical Consequence: A sentence S is a logical consequence of a set of premises if it is impossible for the premises all to be true while the conclusion is false.

Logical Equivalence: Two sentences are logically equivalent if they have the same truth value in all possible circumstances.

Logical Truth or Necessity: A sentence that is a logical consequence of any set of premises. That is, no matter what the premises may be, it is impossible for the conclusion to be false (e.g., $a = a$).

Logical Possibility: A sentence or claim is logically possible if there is a possible circumstance in which it is true.

Tautological Equivalence: S and S' are tautologically equivalent if and only if every row of the joint truth table assigns the same values to S and S'.

Tautological Consequence: Q is a tautological consequence of a set of premises P1, ...Pn, if and only if every row in a truth table that assigns T to P1,...Pn also assigns T to Q.

Is Tet(a) \vee Large(c) a tautological consequence of the following two premises?

Tet(a) \vee \sim Small(b)
 Small(b) \vee Large(c)

How can we tell?

- Negation Normal Form

Logically equivalent sentences can be substituted for one another in the context of a larger sentence and the resulting sentences will also be logically equivalent.

Identity Laws	$p \wedge T \Leftrightarrow p$ $p \vee F \Leftrightarrow p$
Domination Laws	$p \vee T \Leftrightarrow T$ $p \wedge F \Leftrightarrow F$
Idempotent Laws	$p \vee p \Leftrightarrow p$ $p \wedge p \Leftrightarrow p$
Double Negation	$\sim(\sim p) \Leftrightarrow p$
Commutative Laws	$p \vee q \Leftrightarrow q \vee p$ $p \wedge q \Leftrightarrow q \wedge p$
Associative Laws	$(p \vee q) \vee r \Leftrightarrow p \vee (q \vee r)$ $(p \wedge q) \wedge r \Leftrightarrow p \wedge (q \wedge r)$
Distributive Laws	$p \vee (q \wedge r) \Leftrightarrow (p \vee q) \wedge (p \vee r)$ $p \wedge (q \vee r) \Leftrightarrow (p \wedge q) \vee (p \wedge r)$
DeMorgan's Laws	$\sim(p \wedge q) \Leftrightarrow \sim p \vee \sim q$ $\sim(p \vee q) \Leftrightarrow \sim p \wedge \sim q$
Other Useful Equivalences	$p \vee \sim p \Leftrightarrow T$ $p \wedge \sim p \Leftrightarrow F$

S(P) = FOL sentence that contains (possibly complex) sentence P as a component part. S(Q) is a new FOL sentence that is the result of substituting Q (which is logically equivalent to P) into S(P): $S(P) \Leftrightarrow S(Q)$.

Negation Normal Form: Using only DeMorgan's Laws and the double negation equivalence, we can take any sentence built up from \vee , \wedge and \sim and transform it such that each \sim applies only to atomic sentences. To do it, just drive each \sim inward switching \vee and \wedge according to DeMorgan's laws, and canceling any double negations.

$$\sim(\sim(p \wedge q) \vee r)$$

- **Conjunctive and Disjunctive Normal Form**

CNF: A sentence that is a conjunction of one or more disjunctions of one or more literals.

DNF: A sentence that is a disjunction of one or more conjunctions of one or more literals.

Convert the following to CNF:

$$p \vee (q \wedge \sim(r \wedge (\sim s \vee t)))$$

1) Push the first NOT down to a literal using DeMorgan's Laws:

$$\begin{aligned} p \vee (q \wedge \sim(r \wedge (\sim s \vee t))) \\ p \vee (q \wedge (\sim r \vee \sim(\sim s \vee t))) \\ p \vee (q \wedge (\sim r \vee (s \wedge \sim t))) \end{aligned}$$

2) Use the distributive law for OR over AND to push the first OR below the first AND:

$$\begin{aligned} p \vee (q \wedge (\sim r \vee (s \wedge \sim t))) \\ (p \vee q) \wedge (p \vee (\sim r \vee (s \wedge \sim t))) \end{aligned}$$

3) We regroup using the associative law $[(p \vee q) \vee r \Leftrightarrow p \vee (q \vee r)]$

$$(p \vee q) \wedge ((p \vee \sim r) \vee (s \wedge \sim t))$$

4) Finally use the distributive law again:

$$(p \vee q) \wedge ((p \vee \sim r \vee s) \wedge (p \vee \sim r \vee \sim t))$$

Can a sentence be in both CNF and DNF?
